Good news for your Scope 3: SBTi V2.0 recognises high-integrity insetting

A short briefing for Carbon Inset Programme customers

In June 2026 the Science Based Targets initiative published the final **Corporate Net-Zero Standard V2.0**. For participants in the Carbon Inset Programme (CIP) who have been clearly engaged in driving reductions across their Scope 3 emissions, this marks a positive shift and strengthens the value of the inset certificates DP World provides to you through the CIP.

What changed

V2.0 introduces additional layers of credible Scope 3 action. Alongside direct action, it formally recognises shared systems, grouped by "**activity pools**" or "**sector-wide,**" as legitimate places to reduce emissions. SBTi specifically calls out **logistics networks** as an eligible activity pool for which market instruments are valuable and viable tools to drive progress towards net zero.

SBTi has implemented this because most companies cannot directly decarbonise their logistics operations on their own. The new standard recognises that acting at the logistics-network level is a credible route to generate real scalable reductions. This is exactly what the Carbon Inset Programme enables.

In plain terms: insetting through your logistics network is no longer a grey area. It now has a clearly named place within the SBTi standard.

What this means in practice

Until today, your inset certificates were recognition of action going above and beyond what the standard formally accounted for. Now, they are clearly **SBTi-aligned instruments that can contribute to your pathway to your net-zero target**.

Our inset certificates are credible demonstrations of the action you are taking to address hard-to-abate Scope 3 emissions within your supply chain, across marine freight, road freight and container handling services.

We are proud to be your partner in delivering this. The Carbon Inset Programme gives you direct, traceable access to these reductions, an efficient and traceable route to credible Scope 3 decarbonisation that would otherwise be out of reach.

Designed to the highest integrity standards

We are proud to have designed our certificates to the highest integrity standards available and now those efforts have been rewarded. With V2.0 published, we find our certificates to be perfectly aligned with the integrity criteria SBTi now sets out for market instruments in Section 4.2. Every certificate is:

- **Additional:** reductions are demonstrably additional, evidenced against established frameworks.
- **Activity- and system-matched:** each reduction sits within the same logistics network and activity that generates your emissions.
- **Representative and volume-matched:** each certificate conservatively conveys the real, physical attributes of the underlying activity, and never exceeds it.

DP WORLD

- **Uniquely attributed, with no double counting:** serialised and registry-tracked, so a reduction is claimed once, and only by you.
- **Verifiable:** backed by auditable, assurance-ready documentation.
- **Time-aligned:** matched to your activity within the timeframe the standard requires.

The bottom line

With V2.0 final, high-integrity insetting through logistics networks is recognised, credible and coherent with progress toward your validated SBTi targets. The Carbon Inset Programme makes it simple to access traceable, high-integrity reductions, ready to support the Scope 3 work you need to deliver.
